Pregnancy

Possible Reactions to Treatment by Hivamat 200

Patients suffering from chronic disorders may at first react to therapy with the following symptoms:

Acute pain sensations in the area undergoing treatment, mostly three to four hours after conclusion of treatment. These complaints usually persist for several hours before they ease all of a sudden, often after urination.

Increased desire to urinate. It is possible that colour and smell of the urine are entirely different.

Hypersensitivity of the skin in the area of treatment, which can persist up to several days.

Tiredness ranging from lassitude to exhaustion.

Rise in temperature (local, rarely).

Reduction in blood pressure
